

Test Plan and Report

Pathfinder June 2025

Jason Son, Larry Balagula, Aniketh Billa, Gavin Pai, Aneesh Komaragiri

System Test & Scenarios

- A. User Story 1: As a user, I want to view a map instance that represents UC Santa Cruz so that I can accurately navigate and interact with events.
 - B. User Story 2: As a user, I want to authenticate so that I can access Pathfinder to its fullest extent, enabling me to access all events and being able to create as well.
 - C. User Story 3: As a registered user, I want to create events and ensure that they persist on server-side and database.
-
- Scenario 1: Create map instance (pass/fail)
 - start Pathfinder app; should be defaulted on map view
 - verify that map container is properly rendered in DOM and a valid reference is available
 - when container is ready, mapboxClient singleton will init with properties:
 - container: container (the map ref element)
 - style: mapbox://styles/jvson/cm9p1p5yz00db01rmguae0rj3
 - initial coordinates: -122.05886, 36.99558
 - zoom: 9

- max bounds: array with lower left [-122.10174, 36.96634] and upper right [-122.01639, 37.0263] limits
 - confirm map renders correctly on client side with given settings
 - verify that when component unmounts, mapboxClient will destroy this current instance
 - outcome:
 - pass if map init with given settings, displays properly, and cleans up on dismount
 - fail if any of the above steps do not occur
- Scenario 2: Authentication (pass/fail)
 - launch pathfinder app; should not be already authenticated
 - trigger authentication “unlinked” modal in bottom left; verify the modal asks user to generally sign in to continue and **Sign In with Google** button is successfully redirecting to OAuth
 - verify sign in with a UCSC email; else, will not be passed through authentication
 - check if the modal eventually closes after successful auth; bottom left icon should now be a “linked” state
 - outcome:
 - pass: if the modal displays correctly after trigger, if authentication status changes after successful sign-in and icon is “linked”
 - fail: if any of above steps does not perform as expected or does not occur

- Scenario 3: Event Creation and Form Handling (pass/fail)
 - launch pathfinder app; assume authenticated already
 - enter waypoint mode through top left (plus) icon; click on any location in the map after pressing button
 - verify `when a waypoint is selected, a popup shows to Navigate or Create Event
 - click the Create Event button, which should switch view to Personal or Organization event form based on view type. confirm that form fields (name, tags, description, date, start time, end time) are present and editable
 - fill in event details:
 - name: test event
 - tags: optional
 - desc: test test test
 - date: 2025-06-10
 - start time: 12:00
 - end time: 14:00
 - press create once all fields are present and implemented
 - on submission, an api call is made to database with correct props, including waypoint coords
 - after event is made, form closes and database will reflect by presenting that event by default; cancelling this form will not avail any database result
 - outcome

- pass: if the event creation form displays, collects, and validates input correctly, the event is inserted via the API, and the map updates to show the new marker
- fail: if any of these steps do not occur as expected (e.g., missing fields, API error, or form failure to close), then the scenario fails

Unit Tests

We did not develop any unit tests due to our app relying on rendering highly interactive, UI-driven features. The main value often comes from integration or end-to-end tests, which were not made in our case.

Additionally, we did not have any utility functions that could be unit tested.
